### **Molecular polarity video Chemical bonds Khan Academy**

Like bonds, molecules can also be polar. In a polar molecule, electron density is unevenly distributed throughout the molecule, resulting in regions of partial negative charge and regions of partial positive charge. Molecular polarity depends on both individual bond polarities and molecular geometry, the latter of which we can predict using VSEPR theory.

### **Dipole dipole forces video Khan Academy**

Dipole-dipole forces occur between molecules with permanent dipoles (i.e., polar molecules). For molecules of similar size and mass, the strength of these forces increases with increasing polarity. Polar molecules can also induce dipoles in nonpolar molecules, resulting in dipole-induced dipole forces.

### **Intermolecular forces video Khan Academy**

Different types of intermolecular forces (forces between molecules). Dipole-dipole? Yes, because the molecule has polar C=O groups. Dipole-induced dipole and London Dispersion forces are also present, but they are small in comparison to the dipole-dipole forces. P.S. I think that I am addicted to Khan Academy! Reply.

### **London dispersion forces video Khan Academy**

London dispersion forces result from the coulombic interactions between instantaneous dipoles. Dispersion forces are present between all molecules (and atoms) and are typically greater for heavier, more polarizable molecules and molecules with larger surface areas.

So if the difference in electronegativity is greater than 0.5, you can go ahead and consider it to be mostly a polar covalent bond. If the difference in electronegativity is less than 0.5, we would consider that to be a non-polar

covalent bond. Now, I should point out that we're using the Pauling scale for electronegativity here.

Dipole moments are measured in the SI units of coulomb meters (C m), but because the charges tend to be very small in magnitude, the historical unit for a dipole moment is the Debye. One Debye is approximately  $3.33 \times 10^{-30}$  C m. A typical dipole moment for a molecule is about 1 D.
