Abstract. Most laws of physics and mechanics are expressed with the help of differential relationships between tensor values. Since these laws must be objective, i.e. they must not depend on the choice of a coordinate system, so differentiation of tensors must take this feature into account.

Another way of generalizing the idea of tensor, common in nonlinear analysis, is via the multilinear maps definition where instead of using finite-dimensional vector spaces and their algebraic duals, one uses infinite-dimensional Banach spaces and their continuous dual. Tensors thus live naturally on Banach manifolds and Frchet manifolds.

In mathematics and physics, a tensor field assigns a tensor to each point of a mathematical space (typically a Euclidean space or manifold). Tensor fields are used in differential geometry, algebraic geometry, general relativity, in the analysis of stress and strain in materials, and in numerous applications in the physical sciences. As a tensor is a generalization of a scalar (a pure number

Glossary of tensor theory Wikipedia

The rank of a tensor is the minimum number of rank-one tensor that must be summed to obtain the tensor. A rank-one tensor may be defined as expressible as the outer product of the number of nonzero vectors needed to obtain the correct order. Dyadic tensor. A dyadic tensor is a tensor of order two, and may be represented as a square matrix.

History. The concepts of later tensor analysis arose from the work of Carl Gauss in differential geometry, and the formulation was much influenced by the theory of algebraic forms and invariants developed in the middle of the nineteenth century. [2] The word "tensor" itself was introduced in 1846 by William Rowan Hamilton [3] to describe something different from what is now meant by a tensor.
